Test Task

0. Configure MS Visual Studio Professional 2014 and open attached solution. Make a code overview and understand the logic of the application. See the an example in class implementation: **AnalysisModule.IDataPreparator**

1. Extend the project **AnalysisModuleTaskX** with the logic into methods **FetchData**() and **Calculate**(). The first methods should get data and the second should calculate "Mean rate of a patient's growth per each doctor".

2. Test your logic with a unit test in **AnalysisModuleTaskXTests**

3. Ask questions if needed to Artem or Martin.

Bonus: if you can, please provide before implementation an estimation of the time needed for your implementation.
